ABSTRACTED-PUB-NO: SU 740085A  
BASIC-ABSTRACT:

Separate image receivers (1) are isolated from a 1st displacement register (2) by a transfer closure (3). When the closure (3) is opened, all charges accumulated in the receivers (1) are transmitted in parallel to the 1st displacement register (2). After closing of the closure (3), the receivers (1) begin to accumulate charges of the next line, while the earlier accumulate line of the image is transmitted by register (2) to an output device (4), connected in series with an input device (5) of a 2nd displacement register (6).

Information is transmitted by the 2nd register (6) to the 2nd output device (7) with a delay of 1 line in the 2nd displacement register (6). During a repeated cycle, the 1st and 2nd output devices (4,7) simultaneously read the information passing from the same image receivers (1) but with a shaft by 1 line. The read information passes to a differential amplifier (8), where by-line subtraction is carried out, to eliminate effect of variation of parameters of the receivers.

ADVANTAGE - Elimination of effect of variation of parameters of information receivers. Bul. 14/30.7.94
